

PORTFOLIO

Aldi Riansyah

2 0 2 6

Hello,

I'm Aldi Riansyah

Hybrid Mobile Developer

A professional Flutter Developer who is looking for new career opportunities.

I am interested in working as a Flutter Developer both onsite and remotely, I've contributed to mobile app creation in well-known companies in Indonesia.

Project STRADE Mobile

Company: PT Gajah Nusantara Raya
Role: Mobile Application Developer

Project Overview

Strade Mobile is an AI-powered trading platform designed to help users access automated trading bots and financial market insights. The application provides real-time information on stocks, gold, and cryptocurrency markets through TradingView integration, along with community features and the latest financial news. I was responsible for building the application from the ground up, taking it from initial development to successful deployment on both Google Play Store and Apple App Store.

Technologies :

Flutter & Dart, BLoC State Management, Clean Architecture, REST API, Socket.IO, WebView, Google ML Kit (OCR), Payment Gateway Integration, TradingView Integration, ProGuard, Firebase, Git

My Role

Designed and developed the mobile application from scratch.
Implemented scalable architecture using Clean Architecture and BLoC.
Integrated REST APIs and real-time communication using Socket.IO.
Built secure payment workflows through payment gateway integration.
Implemented OCR-based identity verification using Google ML Kit for KTP scanning.
Integrated TradingView charts for real-time financial market visualization.
Optimized application performance and stability across Android and iOS.
Configured release builds and successfully published the application to Google Play Store and Apple App Store.
Collaborated with backend developers, QA engineers, and UI/UX designers throughout the development lifecycle.

Challenges Solved

Built the entire application from concept to production deployment.
Implemented real-time market price updates using Socket.IO for a responsive trading experience.
Integrated TradingView within Flutter using WebView while maintaining smooth performance and user interaction.
Developed OCR functionality using Google ML Kit to automate KTP data extraction during user verification.
Integrated a secure payment gateway supporting multiple payment methods.
Strengthened application security by implementing root detection and anti-tampering mechanisms to reduce security risks.
Optimized application performance, memory usage, and startup time for a smooth cross-platform experience.
Ensured maintainable and scalable code by applying Clean Architecture principles and modular development.

Company: PT Gajah Nusantara Raya
Role: Mobile & Desktop Application Developer

Project Overview

Satu Agen is a wholesale marketplace platform designed specifically for cooperative agents across Indonesia. The application enables cooperative agents to manage product orders, membership, payments, and logistics through a single integrated platform. It was built to support both online and offline operations, ensuring uninterrupted business activities even in areas with limited internet connectivity.

I was responsible for developing the application from the ground up, from initial architecture and feature implementation to production deployment.

Technologies: Flutter & Dart, Clean Architecture, BLoC State Management, REST API, SQLite (Offline Database), Socket.IO, Payment Gateway Integration, QRCode & Barcode Scanner, Thermal Printing, Auto Synchronization, Git

My Role

Led the end-to-end development of the mobile and desktop applications, from system architecture and implementation to production deployment.

Designed and implemented a scalable architecture using Clean Architecture and BLoC.

Integrated REST APIs with backend services.

Built a robust offline-first system with automatic data synchronization when the device reconnects to the internet.

Integrated payment gateway services for secure digital transactions.

Connected the application with the Satu Ekspedisi logistics platform for shipment management.

Implemented cooperative membership card printing and QR code scanning for fast and secure user authentication.

Developed real-time notifications and payment confirmation using Socket.IO.

Collaborated closely with backend developers, UI/UX designers, and QA throughout the development lifecycle.

Challenges Solved

Built the application from concept to production deployment.

Designed an offline-first architecture, allowing users to continue business operations without an internet connection.

Implemented an automatic synchronization mechanism to safely synchronize local data once the device reconnects online.

Integrated secure payment gateway services supporting multiple payment methods.

Developed real-time notifications and instant payment confirmation using Socket.IO.

Integrated logistics services with the Satu Ekspedisi platform to streamline delivery management.

Implemented QR code scanning and membership card printing to simplify cooperative member identification and authentication.

Optimized application performance and ensured consistent behavior across mobile and desktop platforms.

Applied modular architecture and clean coding principles to improve maintainability and future scalability.

★ Key Highlights

Developed a cross-platform application from scratch for both mobile and desktop.

Implemented an offline-first architecture with automatic synchronization.

Integrated multiple third-party services, including payment gateway, logistics, and real-time communication.

Built scalable and maintainable software using Flutter, BLoC, and Clean Architecture.

Improved business continuity by enabling users to operate seamlessly in both offline and online environments.

Project Satu AGEN

Company: PT Gajah Nusantara Raya
Role: Mobile Application Developer

Project Overview

Satu Ekspedisi User is a technology-driven logistics application that allows users to book delivery services, track shipments in real time, communicate with drivers, and manage digital payments. The application serves as the official logistics platform integrated with the Satu Agen marketplace ecosystem. I was responsible for developing the application from scratch, covering feature implementation, API integration, and production deployment.

Technologies: Flutter & Dart, GetX, REST API, Socket.IO, Google Maps, OpenStreetMap, OSRM (Open Source Routing Machine), Camera & File Picker, PDF Generation, Digital Wallet, Git,

My Role,

- Developed the entire mobile application from the ground up.
- Integrated REST APIs with backend services.
- Built delivery booking and order management workflows.
- Implemented interactive maps with location search and address selection.
- Developed a digital wallet supporting top-up and withdrawal transactions.
- Built a real-time chat system between customers and drivers.
- Generated digital invoices and PDF receipts after completed deliveries.
- Collaborated with backend developers to ensure reliable API integration and real-time communication.

Challenges Solved

- Designed a seamless delivery booking experience with accurate location selection.
- Implemented real-time shipment tracking and status updates using Socket.IO.
- Integrated OSRM to provide optimized routing information.
- Developed a secure wallet system for digital payments.
- Built real-time customer-driver communication.
- Implemented automatic PDF invoice generation after each completed delivery.
- Optimized application performance for a smooth user experience.

Key Highlights

- Built the application from scratch to production.
- Integrated multiple third-party services, including maps, routing, real-time communication, and digital payments.
- Delivered a scalable and maintainable Flutter application using modern development practices.

Satu Ekspedisi User

Company: PT Gajah Nusantara Raya
Role: Mobile Application Developer

Project Overview

Satu Ekspedisi Driver is the driver companion application for the Satu Ekspedisi logistics ecosystem. The application enables drivers to receive delivery requests, navigate efficiently, communicate with customers, track deliveries in real time, and manage earnings through an integrated wallet system.

I independently developed the application from scratch within a relatively short timeline, leveraging AI-assisted development tools to accelerate implementation while maintaining code quality and engineering best practices.

Technologies: Flutter & Dart, GetX, REST API, Socket.IO, Google Maps, OpenStreetMap, OSRM, Google Maps Navigation, Camera, File Picker, PDF Generation, Digital Wallet, Git, AI-assisted Development (ChatGPT, Cursor, Claude)

My Role

Developed the complete driver application from scratch.

Built order management and delivery workflow features.

Implemented navigation by converting delivery routes directly into Google Maps.

Developed real-time driver location updates using Socket.IO.

Integrated optimized routing using OSRM.

Built an in-app chat system for communication with customers.

Developed wallet features for managing driver earnings, including top-up and withdrawal functionality.

Implemented digital receipt generation after completed deliveries.

Optimized application performance and ensured a smooth delivery experience.

Challenges Solved

Built a complete driver application within a tight development timeline.

Implemented real-time GPS tracking with Socket.IO for accurate driver location updates.

Integrated OSRM routing with Google Maps navigation for efficient delivery routes.

Developed a reliable real-time chat system between drivers and customers.

Built a secure digital wallet for managing driver balances and payouts.

Generated PDF receipts automatically after delivery completion.

Improved application stability and maintainability through modular Flutter architecture.

Key Highlights

Independently developed the driver application from concept to production.

Leveraged AI coding tools responsibly to accelerate development while maintaining engineering quality.

Integrated real-time location tracking, navigation, digital payments, and communication into a single application.

Built a scalable Flutter application optimized for logistics operations.

Satu Ekspedisi Driver

Project SmartColl BTN

Company: Bank BTN
Role: Flutter Developer

Project Overview

BTN Smart Collection is a digital collection platform that helps field officers manage customer visits, monitor locations, and improve collection activities.

Technologies

Flutter
Provider
Clean Architecture
REST API
GPS
Google Maps
Git

My Role

Migrate Apps From Android Native kotlin to Flutter
Developed GPS tracking features.
Integrated backend APIs.
Improved application architecture.
Redesigned the user interface for a better user experience.
Optimized application performance.

Challenges Solved

Implemented real-time GPS tracking.
Reduced application loading time by approximately 20%.
Built a scalable and maintainable application using Clean Architecture.

Project myEV Etrans

Company: eTrans

Role: Flutter Developer

Project Overview

myEV is an electric vehicle platform providing charging station services, battery swapping, EV rentals, and eco-friendly delivery services.

Technologies

Flutter

Google Maps

REST API

Firebase

Git

My Role

Developed EV service features.

Integrated location and mapping services.

Implemented backend API communication.

Improved application performance.

Challenges Solved

Optimized map rendering and location services.

Improved API performance.

Enhanced overall application stability.

Project PESA

Company: PT Mega Giga Solusindo | Pt Icon Plus
Role: Flutter Developer

Project Overview

PESA is an internal super application designed for PLN employees, providing attendance management, daily activity reporting, facility requests, and hybrid working support.

Technologies

- Flutter
- Dart
- REST API
- Firebase
- Git
- Clean Architecture

My Role

- Developed employee service modules.
- Integrated backend APIs.
- Implemented new features.
- Maintained application quality through testing and debugging.

Challenges Solved

- Improved application performance.
- Optimized data synchronization.
- Enhanced user experience for enterprise users.

Project PLN Mobile

Company: PT Mega Giga Solusindo | PT Icon plus

Role: Flutter Developer

Project Overview

PLN Mobile is Indonesia's official electricity service application that provides bill payments, token purchases, outage reporting, customer services, and electricity usage monitoring.

Technologies

Flutter

Dart

REST API

Firebase

Git

My Role

Developed and maintained Flutter application features.

Integrated APIs with backend systems.

Improved application performance and fixed production issues.

Worked closely with QA and backend engineers.

Challenges Solved

Enhanced application responsiveness.

Improved API reliability.

Reduced application crashes through bug fixing and optimization.

Project BAF

Company: PT Bussan Auto Finance

Role: Android Mobile Developer

Project Overview

BAF Mobile is a financing application that enables users to apply for vehicle, electronics, and consumer financing through a digital platform.

Technologies

Java

Kotlin

Android SDK

REST API

Git

My Role

Developed and maintained Android application features.

Implemented financing-related modules.

Fixed production issues and improved application stability.

Collaborated with backend developers and QA.

Challenges Solved

Improved application performance.

Optimized user interaction for financing workflows.

Reduced bugs affecting user experience.

Company: DKatalis
Role: Mobile Application Developer

Project PX

People Experience [PX]

Project Overview

People Experience (PX) is an internal HR platform used by Bank Jago, DKatalis, and Amaan Digital to streamline employee management, including onboarding, leave requests, reimbursements, performance management, and employee communication.

Technologies :

- Flutter
- Dart
- REST API
- Firebase
- Git
- Clean Architecture
- State Management (GetX)

My Role

- Developed and maintained mobile application features.
- Integrated REST APIs with backend services.
- Collaborated with designers, backend engineers, and QA teams.
- Improved application performance and stability.
- Fixed bugs and delivered new features following Agile development practices.

Challenges Solved

- Optimized application performance for large-scale enterprise usage.
- Improved API integration reliability and error handling.
- Enhanced user experience by refining existing features and reducing application issues.

Project BFS

Company: DKatalis / Bank Jago
Role: Mobile Application Developer

Project Overview

Business Financial Solution (BFS) is a digital banking application that integrates banking and fintech services, enabling users to manage savings, payments, deposits, and financial activities through Bank Jago’s ecosystem.

Technologies

- Flutter
- Dart
- REST API
- Firebase
- Git
- Clean Architecture

My Role

- Developed new Web features.
- Integrated backend APIs.
- Maintained existing application modules.
- Collaborated with cross-functional teams during development and testing.
- Improved application quality through bug fixing and code optimization.

Challenges Solved

- Improved application performance and responsiveness.
- Optimized API communication for better user experience.
- Ensured application stability during feature enhancements.

Project Digisekre

Company: PORMIKI Jawa Barat
Role: Full Stack Developer

Project Overview

DigiSekre is a membership management platform for the Indonesian Association of Medical Recorders and Health Information Professionals (PORMIKI), supporting member administration, financial reporting, and organizational management.

Technologies

- Laravel 11
- Laravel Filament 3
- Spatie Permission
- Tailwind CSS
- MySQL

My Role

- Designed and developed role-based dashboards.
- Built member management features.
- Developed financial reporting modules.
- Optimized mobile responsiveness.

Challenges Solved

- Automated member management for over 2,000 users.
- Reduced manual reporting time by approximately 80%.
- Improved usability across desktop and mobile devices.
